10. HAFTA SORULAR (WEEK 10 QUESTIONS)

8 elemanlı float diziye klavyeden değer girin. Girilen değerlerin ortalamasını hesaplayıp ekrana yazdırın.

Enter a value from the keyboard to the 8-element float array. Calculate the average of the entered values and print it on the screen.

Klavyeden -1 girilene kadar girilen sayıları diziye aktaran, ardından her elemanın karesini ekrana basan programı yazınız. (Dizi eleman sayısı max 10 olacaktır.)

Write a program that transfers the numbers given until -1 is entered from the keyboard, and then prints the square of each element to the screen. (The number of array elements will be maximum 10.)

Maksimum 5 basamaklı sayının basamaklarındaki rakamları diziye atan ve ekrana basan programı yazınız.

Write a program that assigns the digits of the maximum 5-digit number to an array and prints it to the screen.

10 elemanlı diziyi klavyeden alan ve tersten ekrana yazan programı yazınız. (1,5,2,4,5,6,78,12,1,3 => 3,1,12,78,6,5,4,2,5,1)

Write a program that takes a 10-element array from the keyboard and writes it in reverse to the screen. $(1.5,2,4,5,6,78,12,1.3 \Rightarrow 3.1,12,78,6,5,4,2,5,1)$

```
□#include <stdio.h>
      | #include <stdlib.h>
 2
